

Part C: Data Request

CAP182 Capstone Project: STADIOEquities

Introduction

This data request specifies the fields required to build a model predicting whether a newly registered STADIOEquities client will make a first deposit within 30 days of registration, using a decision point at day 3 (the earliest point at which onboarding progress and first-session behaviour are observable, but before most drop-off has occurred). Fields are grouped by source system, consistent with the data landscape described in STADIOEquities' internal Company Information Pack (STADIOEquities, 2026).

All predictor fields are drawn from information available by day 3 post-registration. The outcome variable is observed at day 30 and is used only to label the training data; it is never a predictor.

Table 1: Client Demographics & Registration

Column name	Data type	Example	Additional information
client_id	String (identifier)	CU-0284719	Unique client identifier; not a predictive feature
registration_date	Date	2026-03-14	Anchor date for the day-3/day-30 windows
age	Integer	27	Range: 18–100
province	Categorical	Gauteng	Valid values: Eastern Cape, Free State, Gauteng, KwaZulu-Natal, Limpopo, Mpumalanga, North West, Northern Cape, Western Cape
stated_investment_goal	Categorical	Long-term wealth building	Valid values: Retirement, Short-term growth, Learning/exploring, Wealth building, Other
stated_risk_appetite	Categorical	Medium	Valid values: Low, Medium, High
acquisition_channel	Categorical	Social media ad	Valid values: Social media ad, Search ad, Referral, Organic/direct, Influencer, Other

Table 2: Onboarding / KYC Progress (as at day 3)

Column name	Data type	Example	Additional information
client_id	String (identifier)	CU-0284719	Foreign key to Table 1
kyc_status_day3	Categorical	In Progress	Valid values: Not Started, In Progress, Completed, Abandoned; status as observed at the day-3 checkpoint only
onboarding_steps_completed_day3	Integer	3	Range: 0–N, where N = total onboarding steps in the platform's registration flow. Client to confirm exact step count and step definitions.
step_last_abandoned	Categorical	Bank account linking	Valid values: None, ID Verification, Bank Account Linking, Risk Questionnaire, Proof of Address; "None" if fully completed
time_to_kyc_complete_hours	Float	14.5	Null if not completed by day 3; hours from registration to KYC completion

Table 3: App & Web Behaviour (first-session / day-3 window)

Column name	Data type	Example	Additional information
client_id	String (identifier)	CU-0284719	Foreign key to Table 1
time_to_first_session_hours	Float	2.3	Hours between registration and first app/web session
first_session_duration_minutes	Float	6.8	Length of the first session
screens_viewed_first_session	Integer	5	Count of distinct screens viewed in first session
sessions_by_day3	Integer	4	Total number of sessions within the first 3 days
device_type	Categorical	iOS	Valid values: iOS, Android, Web

Table 4: Funding / Account Status (target variable)

Column name	Data type	Example	Additional information
-------------	-----------	---------	------------------------

client_id	String (identifier)	CU-0284719	Foreign key to Table 1
deposited_within_30_days	Binary (target)	1	TARGET VARIABLE. Valid values: 1 = deposited within 30 days, 0 = did not. This is the outcome the model predicts, not a feature.
date_of_first_deposit	Date	2026-04-02	Null if deposited_within_30_days = 0
account_status_day30	Categorical	Funded & active	Valid values: Funded & active, Never funded, Funded then dormant; descriptive, not a predictor (only known after day 30)

deposit_amount_first is deliberately excluded: it is only known after the outcome occurs, so it cannot serve as a day-3 predictor and risks data leakage if included.

Table 5: Marketing / Acquisition

Column name	Data type	Example	Additional information
client_id	String (identifier)	CU-0284719	Foreign key to Table 1
acquisition_cost_zar	Float	180.00	Range: R0–R500 (approx.), per the briefing pack's R180 average
nudge_engagement_day3	Categorical	Opened, not clicked	Valid values: Ignored, Opened, Clicked; engagement with onboarding emails/nudges by day 3

Design Notes

Source separation: Tables are split by the operational system each field originates from (registration/CRM, onboarding/KYC, app analytics, funding ledger, marketing platform), matching STADIOEquities' data landscape (STADIOEquities, 2026), rather than by convenience groupings.

acquisition_channel is a static client attribute fixed at registration and is kept in Table 1 rather than duplicated in Table 5, which is reserved for campaign-level and engagement fields.

Leakage discipline: every predictor is timestamped at or before the day-3 decision point. Only the target and the descriptive day-30 status field in Table 4 reach past that point, and neither is used as a model input.
